

## LEED Specification Sheet for New Construction and Major Renovation

6/7/2021

To Whom It May Concern:

This letter has been written to verify the VOC content of the two-part emulsion polymer isocyanate (EPI) system for ReacTITE EP-925. The current VOC content of the ReacTITE EP-925 resin is 8 g/L while the hardener product is VOC free. Accordingly, the VOC content of this EPI system is less than 30 g/L. That is the current VOC content limit of California's South Coast Air Quality Management District (SCAQMD) Rule #1168 for wood substrate adhesives.

In addition, the two-part ReacTITE EP-925 system has passed California Department of Public Health CDPH/EHLB/Standard Method Version 1.2, 2017 (Emission testing method for CA Specification 01350). This is a requirement for obtaining LEED v4 and v4.1 low emitting materials credit.

Note that this product does not contain any formaldehyde including urea formaldehyde.

Please use this letter for specification purposes and call 1-888-533-9043 with any further questions.
